

FISHING CALCULATOR -2008

Catching Fish Using the Solunar System

The system advises anglers of the relative position of the Sun (SOL) and the Moon (Lunar) in the sky, predicting the likelihood that wildlife and fish actively feed more vigorously on certain days of the moon cycle.

Although the system is a bit complex, simply stated:

The three days before and after a Full or New moon, plus the day of the quarter moons have the most vigorous feeding periods of the 22 day moon cycle.

However, everyday contains a "major" and "minor" feeding period, in which feeding is at its peak.

In the chart below...Peak Days have more "star-dots" than others.

The chart was computed for 89.5 degrees West - - 50.5 degrees North.
